

2007 ANNUAL SILVERSWORD CENSUS

Forest Starr, Kim Starr, and Lloyd Loope

To learn more about the Haleakala Silversword or hinahina (*Argyroxiphium sandwicense* subsp. *macrocephalum*), and to keep a pulse on this park icon, each year the flowering silverswords are counted, and 11 silversword plots are monitored. Below are the results from the 2007 silversword census and plot monitoring. In short, it was a relatively large flowering year (1133 blooms), and a down year in the plots (22% decline).

FLOWERING CENSUS

The Haleakala silversword flowers once and then dies. The silversword flowering census attempts to count all the flowering silverswords each year. The flowering silversword census was sporadically done from 1934 to 1962. Since 1969, the flowering silverswords census has been done almost every year.

- 2007 was a relatively large flowering year, with 1133 blooms. 2007 was the 11th largest year out of 40 years on record.
- The largest year ever was 1991 with 6,632 blooms. The smallest year ever was 1970 with 0 blooms. There were 138 blooms in 2006.
- We still don't know what triggers the silverswords to bloom, with mass events in some years, and hardly any flowering at all in other years.

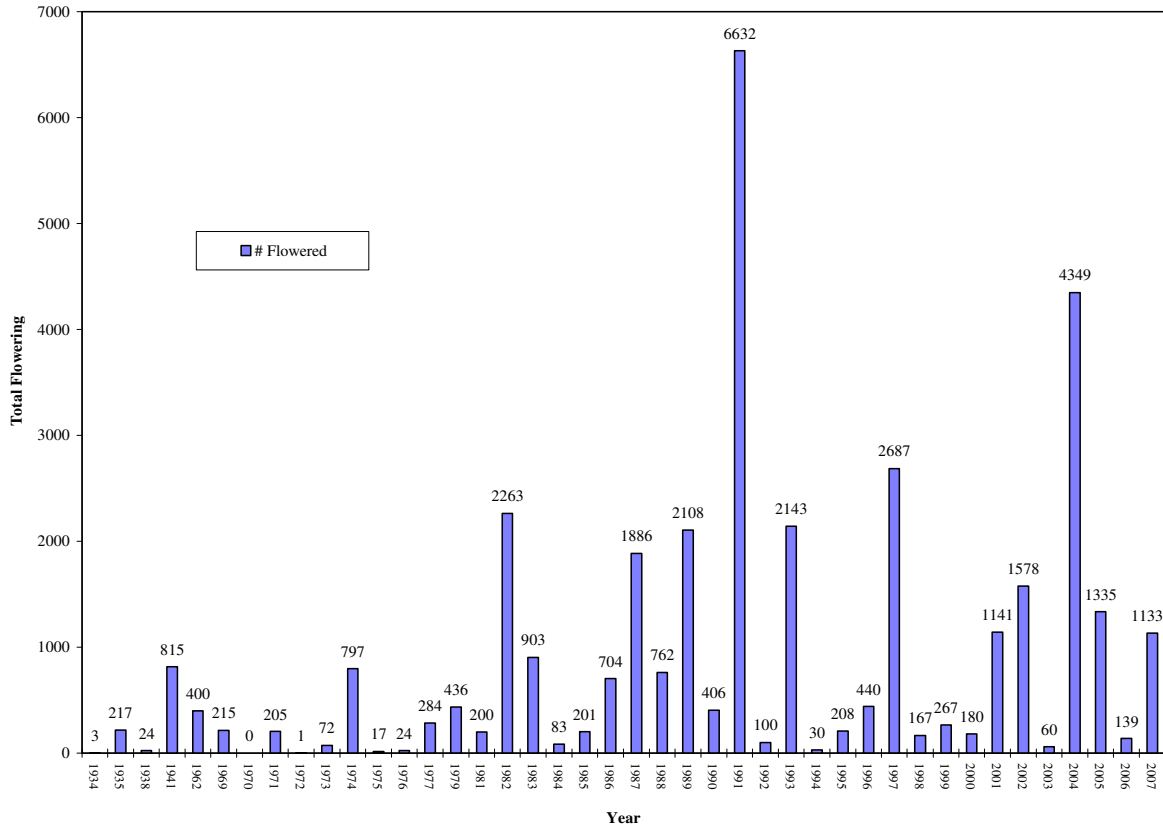

PLOTS

The 11 silversword plots attempt to monitor a representative sample of the silverswords by mapping individual silverswords, measuring live crown diameter of each silversword, and noting life history changes (seedlings, flowered, death). The silversword plots were established in 1982 and have been monitored almost every year since then.

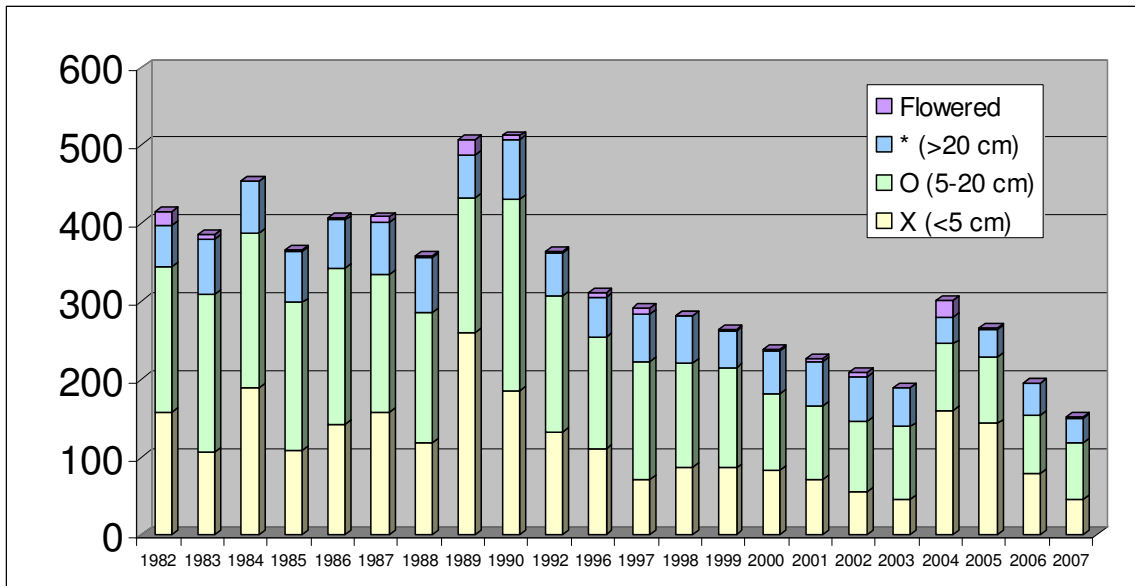

- 2007 was another year of decline. The total number of silverswords in the plots declined 22% (43) from last year, from 195 to 152. The total number of silverswords in the plots dropped by 63% (262) from 1982, from 414 to 152.
- No new seedlings were recorded in the plots this year. Survival for the 3 seedlings from 2006 has been about 33% (1 still alive), for the 25 seedlings from 2005 has been 28% (7 still alive), and for the 127 seedlings from 2004 has been about 17% (22 still alive).
- Of the seedlings still alive, most are still small in size (<5 cm), though 3 of the 2004 seedlings and 1 of the 2005 seedlings are now in the 5-20 cm size class, all of which occur in close proximity to each other in the same plot.
- 2 silverswords flowered in the plots this year. The most flowering silverswords ever recorded in the plots was 22 in 2004.
- 32% (48 of 152) of the silverswords have been in the plots since 1982. In other words, 32% of the silverswords in plots are at least 24 years old, the smallest of these old silverswords is 3 cm in diameter, the largest is 39 cm in diameter.
- One of the silverswords that flowered this year was from 1986, making it 21 years old at the time of flowering.

FLOWERING TOTALS 1934-2007
